Mr WHMIS
GHS Label Making Software

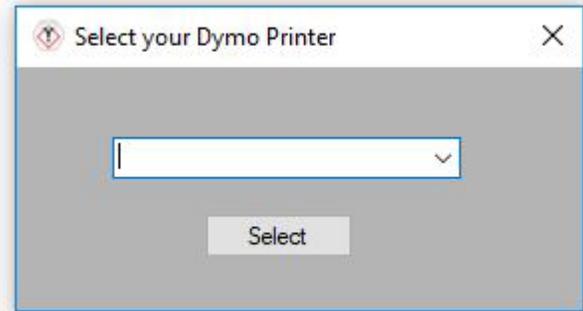

2. Using Mr WHMIS Software

a. First Start-up.

At your first start-up of Mr WHMIS, you will be prompted to select your Dymo printer. The pull-down box will list all of the printers installed on your computer.

You may have several Dymo printers installed.

Select the Dymo printer you intend to print the Dymo 30258 labels, then hit Select.

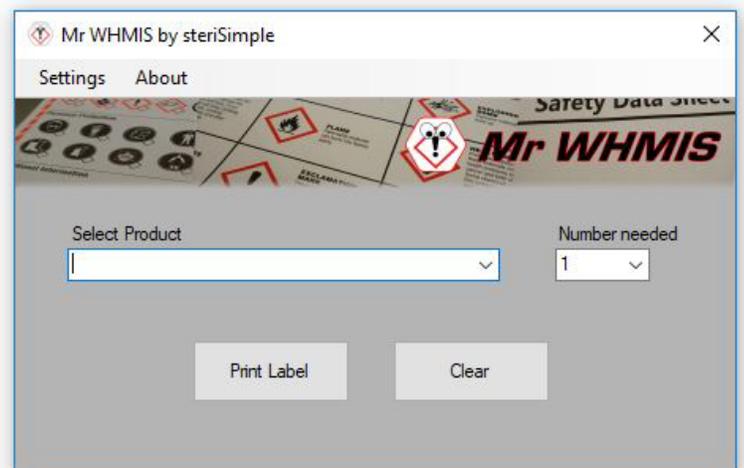

b. Printing a Label.

This is the main screen you will see after you've selected your Dymo printer, and at each start-up afterward.

To print a label, perform the following steps.

- i. Select a product from the pull-down box.
Start typing the name of the product
Hit TAB to direct your mouse to the
"Number Needed" box.
- ii. Select the number of labels you require.
The default setting is one label.
Hit TAB again, to highlight the "Print
Label" button.
- iii. Hit Return or click "Print Label" to print your
labels.
- iv. Hit the "Clear" button if you've made a
mistake.

The selections are reset once the labels have printed. It's easy.

2. Label Updates

a. Updating the Label Library.

Updates will be announced on Facebook.

Update folders will be added to the files in Drop-box.

Please perform the following steps to update your label library.

- i. Download the folder containing the new labels.
- ii. Under Settings, select Upload Label Updates.
- iii. Locate and select the folder you've just downloaded.
- iv. Hit OK.

Mr WHMIS will automatically extract the new labels and copy them to the existing library.

Files that do not match a particular format will not be copied. That is, files other than labels will never make it, so don't worry about making too many mistakes.

You will receive a message indicating successful update. You may safely delete the update folder.

That's all there is to it!

b. Update Requests.

Please LIKE our Facebook page and request updates you may need from there.

www.facebook.com/SteriSimple

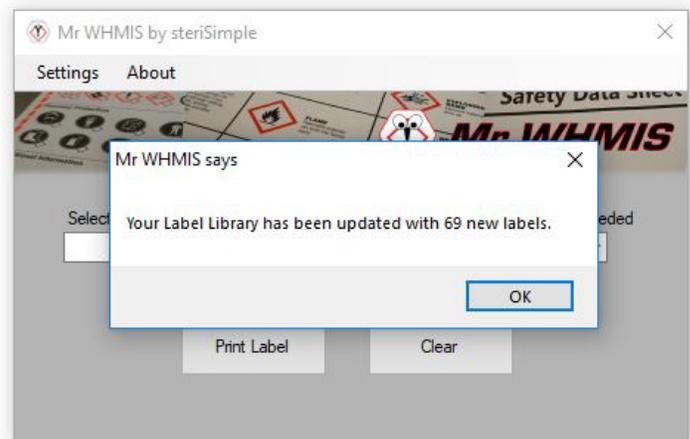

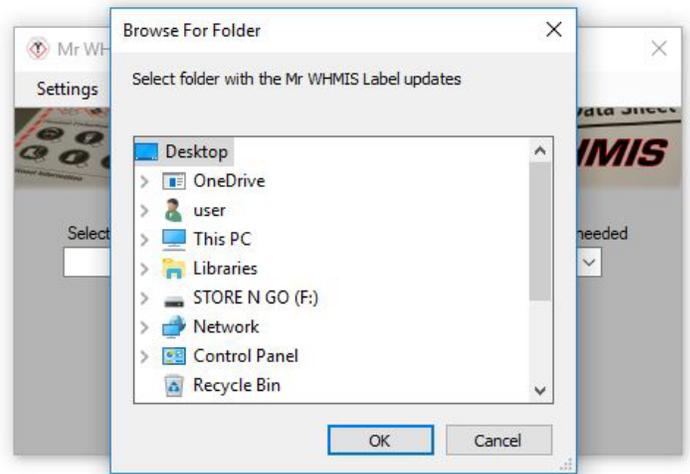

Emailed requests will likely get filtered. We simply won't receive them.

3. Helpful tricks.

a. Laminations.

For several products, we have laminated one label, punched a hole and secured a rubber band through the hole. We will wrap the elastic around OPTIM containers, hang from fire extinguishers, etc. This makes it easy to swap when the product is empty.

Staples makes a self-sealing lamination pouch, product #6447405006, which is perfectly sized for these labels. Affix the printed label to the non-adhesive side and rub together. This does not require a laminator!

b. Small items.

It is not feasible to wrap an etchant syringe or composite with a label. For such items, we've laminated the labels and grouped them together with a key ring. It is kept in storage with such items, for immediate and easy reference.

Please consider using other solutions from SteriSimple in your office and please give us feedback for improvements.
